

AURELIA

AI Astrology Platform

Development Proposal • USD 700

1. Scope of this build

This proposal covers the Aurelia platform built as a fully AI-driven product. Every feature in your development plan that depends on a live human astrologer has been removed. Everything else is included.

In practice this means the app runs on its own. There are no astrologers to recruit, verify, schedule, rate or pay. There are no live sessions to staff. The product works from the first day it is published, at any hour, in any market, with no operational team sitting behind it.

It also removes the most fragile engineering in the plan: real-time calling, live per-minute session billing, and reconnection handling when a call drops mid-session. That area carries the highest risk of delay and the highest chance of billing disputes with users. Leaving it out makes delivery considerably more predictable.

The AI experience itself is not reduced. It is the centre of this build, and it is delivered to the standard your plan sets out.

2. AI Tarot

Tarot leads the build because it is the shortest path to a product that feels genuinely intelligent from the first minute.

A full 78 card deck is implemented: 22 Major Arcana and 56 Minor Arcana across Wands, Cups, Swords and Pentacles, each with its upright and reversed meanings. Cards are drawn through a proper randomised shuffle, placed into the selected spread, and read by the Tarot AI as one connected reading rather than a list of isolated card definitions, exactly as your plan requires.

Relevant Tarot spreads are supported, including the three card past, present and future layout and the ten card Celtic Cross, with each position carrying its own meaning inside the interpretation.

Before the first question, the module delivers the Current Energy reading described in your plan: current emotional energy, what is occupying the user's mind, what they may be struggling with or avoiding, a transition, an unresolved situation, an opportunity, and contradictions in the present energy. It reads as intuitive and personal, not as card definitions.

Tarot needs no date of birth, no time of birth and no chart calculation. A brand new user can receive a meaningful reading within seconds of opening the app for the first time, before entering any personal data at all.

3. AI modules

Your plan states as a mandatory requirement that the app must NOT use one generic AI, and that each module must function as a separate specialised AI with its own methodology, instructions, calculations, interpretation rules, conversation context, question handling, First Instinct Reading, follow-up generation and history. All nine modules are delivered.

Module	Methodology and data used
AI Tarot	78 card deck, randomised shuffle, supported spreads, connected interpretation across the drawn cards and their positions. Answers Tarot questions only.
AI Vedic Astrology	The user's Vedic birth chart and calculations: Ascendant, houses, planets, signs, nakshatra, dasha, transits and aspects. Answers Vedic questions only.
AI Numerology	Life Path, Destiny/Expression, Soul Urge, Personality and Birthday

Module	Methodology and data used
	numbers, with Personal Year and Month cycles. Interprets combinations of numbers rather than explaining the Life Path number alone.
AI Western Astrology	Western birth chart calculations covering planets, signs, houses, aspects and transits. Answers Western questions only.
AI Lal Kitab	Lal Kitab methodology, its own planetary interpretation, and relevant Lal Kitab remedies where applicable.
AI Palmistry	The uploaded palm image. Analyses clearly visible features only: head, heart, life and fate lines, mounts, fingers, palm shape, line depth, branches and unusual markings. States the visible feature behind an observation, and does not claim to see what is unclear in the image.
AI Chinese Zodiac	The full Four Pillars (BaZi): year, month, day and hour, each a Heavenly Stem over an Earthly Branch, with the Day Master, the five element balance across all eight characters, and the year, inner and secret animals. The sexagenary year rolls at Lichun, not on 1 January.
AI Korean Astrology	Saju Palja (사주팔자) on the same four pillars, centred on the Ilgan as the self and read through its relationship to every other character, in Korean stem and branch naming with its own interpretive tradition.
AI Face Reading	The uploaded face photo, read through Mian Xiang structure: the three zones, the five key features, and facial proportion. Analyses only what is clearly visible, names the feature behind each observation, and never comments on attractiveness, ethnicity, health or weight.

Nine modules run on four calculators. Vedic and Lal Kitab read one chart under different rules, Chinese and Korean share one Four Pillars engine, and Palmistry and Face Reading share one vision path. This is why the full set of nine costs far less than nine separate builds, and why further systems can be added later as configuration rather than development.

4. How the AI behaves

The behaviour rules in your plan are treated as core specification, not as extras. This is the part that separates the app from a generic chatbot.

- **First Instinct Reading.** Every module opens with a short personalised reading built from that user's actual data, identifying roughly three to six specific, recognisable patterns. Based on real data, different for every user, no repeated fixed paragraphs, and no generic filler such as "you have a bright future" unless there is specific reasoning behind it.
- **Professional astrologer reading style.** The AI answers the user's actual question first, explains why it reached that conclusion, connects multiple relevant factors, identifies supporting and conflicting indications, gives timing windows where the data supports them, and explains uncertainty naturally instead of inventing certainty.
- **Module protection.** The app always shows which module is active, the AI stays inside that system, and methodologies are never silently mixed. A Tarot question about Vedic dasha is explained and redirected to the Vedic module rather than answered incorrectly. Switching modules is always a deliberate user action.
- **Question understanding.** The AI classifies the question across love, marriage, career, finance, education, family, children, business, travel, relationships and general future, and asks a clarification question where one is genuinely needed. Clarification questions never consume a credit.
- **Automatic follow-up questions.** One to three personalised follow-ups after every answer, built from that specific question and answer, staying inside the active module. Suggestions consume no credit until the user actually submits one, and the interface makes that clear before they tap.

- Conversation memory. Context is remembered within a conversation, birth details are never re-entered, and history is saved separately per module with search, reopen, rename, delete individual conversations and delete all.
- Report integration. Ask AI About This Report on any generated report, with the AI reading the report, explaining difficult terms in plain language, connecting the report to the user's question and generating a follow-up.
- Safety. Predictions are never presented as guaranteed fact, personal details are never fabricated for a wow effect, and sensitive areas including death, serious illness, self-harm, violence, medical, legal and financial matters receive appropriate safe responses. Users can like, dislike, mark not helpful and report any response, with reasons, and admin can review everything reported.

5. Everything else included

Area	Delivered
Onboarding and profile	Email, OTP and Google login, country and region selection, automatic language suggestion, currency and time zone detection, profile creation, birth date, time and place entry, palm photo upload for Palmistry, face photo capture for Face Reading, and camera or gallery permissions where required.
Astrology calculations	Calculation engine covering exact date, time and place of birth, time zone, latitude and longitude, planetary positions, Ascendant, houses, signs, nakshatra, dasha and transits. Calculated data is stored per profile and reused, so the AI reads real calculations rather than guessing them. Calculation methodology is configurable from admin.
Astrology reports	Birth Chart, Personality, Career, Love and Marriage, Finance, Education, Yearly, Compatibility and Transit/Dasha reports. Free preview where applicable, paid full report, view, save, download, share, previous report access, reports in the selected language, and Ask AI About This Report.
Family and multiple profiles	Self, family, partner, friend, child or other person, each with name, relationship, birth details, and palm or face image where applicable. Add, edit, delete, select a profile for a reading or report, and select two profiles for compatibility.
Compatibility analysis	Love, marriage, friendship and business compatibility between two saved profiles, with compatibility score, strengths, potential challenges, relationship dynamics, long-term outlook, timing where applicable, detailed report, save and Ask AI, using the appropriate astrology system.
Daily personalised astrology	A daily reading generated from the user's own profile rather than a generic zodiac horoscope, covering love, career, finance, relationships and general guidance, with current planetary and transit influence where applicable, plus an optional daily notification the user can switch off.
Wallet and AI credits	Question-based credit system, not minute-based. One submitted question equals one credit. Wallet, recharge, balance, credit usage history and transaction history. Purchased, promotional and free credits are tracked separately with priority rules configured by admin, and free ad-earned credits are restricted to AI chat while wallet balance is usable across services, with combination handled where applicable.
Watch ads and earn credits	Daily free AI credits earned by watching completed advertisements, with progress display, remaining daily credits, automatic daily reset, and the option greyed out once the daily limit is reached. Partially watched, skipped or failed ads award nothing, credit is granted only once the ad provider confirms completion, and reward abuse is prevented where technically possible. Admin can enable or disable the feature and change

Area	Delivered
	the daily limit and the ad-to-credit conversion ratio without an app update.
Credit protection	Failed AI responses never permanently consume a credit, a credit deducted before a failure is restored automatically, remaining credits are displayed clearly before a question is submitted, and a user is never charged twice for the same failed request.
Payments	Course, report and AI credit package payments, wallet recharge, secure online payment, confirmation, transaction history and status, refund handling with the amount returned to the wallet where applicable, local currency display, coupon application, payment failure handling and duplicate payment protection.
Referral and coupons	Refer and Earn with a unique referral code, referral link, rewards, history, reward conditions and fraud or duplicate prevention. Coupon codes with percentage or fixed discount, first-user offers, AI question, report and course offers, expiry, usage limits, user-specific coupons and full admin coupon management.
Tarot course	The complete course platform, delivered with Tarot Reading as the launch category. Course listing, categories, details, instructor information, pricing, online enrollment, video lessons, lesson progress, locked and unlocked lessons, sequential unlocking and completion tracking.
Course video security	Secure video streaming, no normal download option, access restricted to enrolled users, protected video URLs and access, and screenshot or screen-recording protection where technically possible.
Course certificate	Automatic completion verification, certificate generation with student name, course name, completion date and certificate ID, certificate access from the profile, and download or share where applicable.
Notifications	Payment, AI credit, daily credit reminder, course enrollment, lesson unlock, certificate, refund, offers and promotions, support ticket updates, important account notifications and daily astrology, with the user able to enable or disable each category.
History and saved items	Payment history, wallet transactions, AI question and credit usage, AI conversations kept separate by module, astrology reports, compatibility reports, enrolled courses, course progress, completed courses, certificates and support ticket history. Saved AI conversations, saved reports, saved profiles, saved compatibility reports and saved courses, with remove and view all.
Profile and settings	Edit profile, update birth details, change language, country and region, currency preferences, notification settings, account and security settings, view history, certificates, wallet, AI credit balance and saved profiles.
Account, privacy and data controls	Change password and security settings, device and login management, logout from all devices, delete AI conversations, delete saved profiles, delete account, data deletion request, privacy policy, terms and conditions, consent management, user data protection, and a clear explanation of how birth details, palm and face images and AI conversations are stored and used.
Global user experience	Region detection driving language suggestion, local currency, time zone and date format. Localisation framework covering interface, astrology content, AI responses, reports, courses, notifications, payments and support, with further languages addable from admin. The app stays visually and culturally inclusive and is not limited to one religion or community.

Area	Delivered
Search and discovery	Global search across the user's own content, courses, reports and saved items.
Customer support	FAQs, support chat, create support ticket, issue categories covering payment, refund, AI, account, technical, course, report and other, screenshot attachment, ticket status, reply to the support team, reopen a resolved ticket, ticket history and support notifications.
App feedback and ratings	Rate the app, submit feedback, report a technical problem, suggest a feature, contact support, and an app-store rating prompt after appropriate user activity.
Error and technical handling	Internet connection, payment, AI response, astrology calculation, server, advertisement loading and advertisement completion failures are all handled with a retry option and clear, user-friendly messages. No payment is deducted when a service fails, no AI credit is consumed when a request fails, credits are restored automatically where deduction already occurred, and recovery is automatic wherever possible.
Admin dashboard	Dashboard and analytics, user management with suspend, block and account deletion handling, payment and wallet management, AI credit management, course, category, lesson, video, progress and certificate management, reports, notifications, offers and promotions, banner and ads management, coupon management, referral management, content management, language and localisation management, and customer support management with ticket assignment, priority, replies, status, refunds and support staff roles and permissions.
Admin AI management	Each AI module managed separately: instructions and prompts, module methodology, AI model and configuration, question pricing, credit requirements, follow-up behaviour, First Instinct Reading behaviour, languages, usage limits, response limits, feedback, reported responses, AI errors, token and API usage, AI cost, performance analytics and abuse controls.
Admin cost and usage control	Track AI API usage, cost per question and token usage, set maximum response and token limits, user-level limits, daily and monthly usage monitoring, spam request prevention, cost alerts, separate cost tracking for every AI module, monitoring of free and ad-generated usage, and avoidance of unnecessary repeated calculations and API calls.
Admin data export	User lists with details, revenue reports, day-wise revenue, transaction reports, transaction IDs, payments and other important business data, downloadable in PDF, Excel or CSV where applicable.
Security	Strong security across application, backend and admin panel, protection against unauthorised access, data theft, misuse and manipulation, and secure storage of sensitive information, API keys, passwords and user data.
Scalability	Database, backend, APIs, storage and overall architecture designed so the user base can grow without the application being rebuilt from scratch.

6. Excluded from this build

Listed plainly so there is no ambiguity at delivery. Everything below involves a live human astrologer, and all of it is out of scope.

- Astrologer discovery: browse, search, filter by expertise, language, rating, price and availability, astrologer profiles, experience and specialisation, ratings and reviews, consultation pricing, favourite astrologers, recently viewed and recommended astrologers.

- Chat consultation, audio consultation and video consultation, including session timers, per-session payment tracking, connection and reconnection handling, session interruption handling, and post-session rating and review.
- The astrologer application and astrologer flow: registration, profile setup, verification and approval, expertise and languages, availability, consultation pricing, receiving consultations, session handling, earnings, history and payouts.
- Talk to an Astrologer handoff from the AI modules, and astrologer recommendation based on the user's question.
- Consultation history, chat history and audio/video session history, consultation notifications, astrologer availability notifications and session reminders.
- Astrologer, consultation and reviews management in the admin panel, astrologer approval, payout management and astrologer list exports.
- Astrologer search and favourite astrologers inside Search & Discovery and Favourites.
- Call connection failure and video connection failure handling in the error handling module.
- Course categories other than Tarot Reading at launch, and the Placement / Career Opportunity module.
- iOS. This build ships on Android.

The platform is structured so the entire astrologer side can be added later as its own phase, on top of what is delivered here, rather than requiring a rebuild.

7. Delivery timeline

Eight weeks from project start to handover, delivered in four two-week milestones. Each milestone ends with something you can open and check rather than a status report.

Milestone	Weeks	Delivered
1 • Foundation and calculations	Weeks 1-2	Backend, database and API structure. Account creation, login, profile, birth detail entry with place lookup, region and time zone detection. The astrology calculation engine, with time zone and historical daylight saving handled correctly. The AI module framework and registry.
2 • The nine AI modules	Weeks 3-4	All nine modules with their own methodology, scope and history. First Instinct Reading, professional reading style, follow-up question generation, module protection, conversation memory, and AI safety and feedback. Multiple profiles and compatibility analysis.
3 • Money and content	Weeks 5-6	Wallet, AI credits with the three credit types and priority rules, watch ads to earn, payments, refunds, coupons and referrals. Astrology reports with preview, purchase and download. Daily personalised astrology. The Tarot course with secure video, progress, sequential unlocking and certificates.
4 • Admin, hardening and handover	Weeks 7-8	Full admin panel including AI module management, cost and token tracking and data export. Notifications, customer support, localisation framework, error handling, security hardening, testing, Play Store submission, and handover of source code and all credentials.

The eight weeks cover development and handover. Two things outside our control can sit between handover and the app being publicly downloadable, and both are worth planning for now rather than discovering at the end.

- Google Play review. A first submission is typically reviewed within a few days, though it can take longer for a new developer account.
- Google Play closed testing. Personal developer accounts created after November 2023 must run a closed test with at least 12 testers for 14 consecutive days, and then pass a production access review, before the app can be published publicly. An organisation account avoids this, but requires a D-U-N-S number, which itself takes time to obtain. This is a Google policy, not a development step, and it is the single most common reason a finished app is not live on the day it is finished.

Our recommendation is to open the Google Play account and start this process in week one, in parallel with development, so the testing window has closed by the time the build is ready.

The timeline assumes the client responds to review points within two working days, and that the Tarot course content, payment gateway account and store account are supplied by the end of week four. Delays on those shift the affected milestone only.

8. Support after delivery

One month of support is included from the date of handover, at no additional cost.

Included:

- Fixing any bug, crash or defect in the features delivered under this proposal.
- Fixing anything that does not work as described in this document.
- Correcting calculation, credit, payment or AI behaviour that does not match the agreed specification.
- Guidance on using the admin panel, and help with configuration changes.
- Assistance with Google Play submission issues and review responses.

Not included, and quoted separately if wanted:

- New features, or changes to the scope agreed in this document.
- The astrologer consultation side, further course categories, placement, or iOS.
- Content creation, including course videos and marketing material.
- Third-party costs, outages or policy changes, such as a payment gateway, ad network or AI provider changing its terms.
- Server, hosting and API usage charges, which are billed to the client's own accounts throughout.

Support requests are answered within one working day. After the first month, ongoing maintenance can be arranged on a monthly retainer if the client wants it.

9. Costs payable by the client

These are separate from the development fee and are paid by the client directly to the provider, on the client's own accounts, in line with the ownership terms in your plan. They are listed here so there are no surprises later.

Item	Cost	Notes
Google Play developer account	USD 25, one time	Required before the app can be published. Needed in week one because of the closed testing window described above.
AI model API usage	Usage based, ongoing	The main running cost, and it scales with how many questions users ask. Every reading is a paid API call. The admin panel tracks cost per question and per module so this stays visible and controllable, and

Item	Cost	Notes
		usage limits are configurable. Budget conservatively before launch and tune the credit pricing against real numbers.
Swiss Ephemeris licence	CHF 700, one time, or free	The standard astronomy library is dual licensed. Its free licence requires the entire application to be released as open source, which is not appropriate here, so commercial use needs the Professional Licence at CHF 700 one time. A free alternative is available and is explained below.
Cloud hosting and database	Free tier, then usage based	Firebase or equivalent. The free tier covers early usage; cost begins to apply as the user base grows.
Payment gateway fees	Percentage per transaction	Set by the chosen gateway, typically around two to three percent plus a fixed fee. Deducted from each payment rather than invoiced.
SMS and OTP	Per message	Only if phone OTP login is enabled. Email and Google login have no per-use cost.
Domain name	Around USD 12 per year	For the admin panel and website presence.
Apple Developer Program	USD 99 per year	Only required if iOS is added as a later phase. Not needed for this Android build.
Advertising network	No cost	The ad network pays the client. This is revenue, not an expense.

On the ephemeris licence, in the spirit of the disclosure clause in your plan.

The Swiss Ephemeris is the industry standard astronomy library behind most astrology software. It is offered either under a free licence that would require the whole of Aurelia to be published as open source, or under a Professional Licence at CHF 700 paid once. The free licence is not compatible with a commercial product, so the paid licence is the only way to use that specific library here.

There is a no cost route. Public domain astronomical models can be implemented directly, giving accuracy of roughly one arc minute or better. Astrological interpretation works in whole degrees, so this difference is not visible anywhere in the product: the ascendant, houses, nakshatra and dasha come out identical. Our recommendation is to launch on the free route and purchase the Professional Licence later only if a specific need appears. The decision is the client's, and it is made before implementation rather than after.

10. Provided by the client

- Tarot course video lessons, instructor details and course material. The course platform is delivered complete and ready to use, but the teaching content itself is supplied by the client.
- Payment gateway account and the business verification documents it requires.
- Google Play developer account, created under the client's own details.
- Business details, email and phone number needed to register the third-party API and service accounts in the client's name.
- Advertising network account for the Watch Ads feature.

11. Ownership and control

The ownership terms in your plan apply to this build in full.

- All APIs required for the app, web and admin are created using the client's email, phone number and business details.
- All API keys, API account details and related credentials are shared with the client at final handover.
- No important API or service remains dependent on the developer's personal account.
- Cloud storage, hosting, server, Google Play, domain, website hosting, database, Firebase or Google Cloud, payment gateway, SMS and OTP services and email services are all registered under the client's ownership, and all login and access details are handed over on completion.
- Everything technically applicable is manageable from the admin dashboard, so the client can add, edit, remove, activate, deactivate, enable or disable features and data without depending on the developer for normal operational changes.
- No hidden trial period, expiry, time limit, developer-controlled activation or deactivation, kill switch or undisclosed dependency. All agreed features work as intended after delivery.
- Any third-party API, software, licence or subscription carrying an expiry, renewal or usage limitation is disclosed before implementation.
- All designs, graphics, icons, images, fonts, illustrations, templates and code components used are legally usable for commercial purposes, and anything requiring a licence is disclosed.
- Complete source code is delivered, and the project is not structured so the client is ever dependent on the developer to access or operate their own application.

12. Commercial summary

Project fee	USD 700
Timeline	8 weeks from start to handover, in four two-week milestones
Support included	1 month after handover, at no additional cost
Platform	Android application, admin panel, and backend
AI modules	All nine: Tarot, Vedic, Numerology, Western, Lal Kitab, Palmistry, Chinese Zodiac, Korean Saju and Face Reading
Client-paid costs	Google Play USD 25 one time, plus usage-based AI, hosting and gateway fees — see section 9
Deliverables	Published application, admin panel, complete source code, all account credentials and API keys
Revenue channels	Rewarded advertising, AI credit packages, paid astrology reports and the Tarot course
Later phases	Live astrologer consultation and the astrologer app, further course categories, placement, and iOS

Each later phase builds on this foundation rather than replacing it, and is funded by a product that is already earning.

Prepared for the Aurelia project. Valid for 30 days from issue.
